AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS

1. (Currently Amended) In a multi-hop network including a plurality of nodes that each maintains a table of network topology, a method for disseminating topology and link-state information over the multi-hop network, comprising:

maintaining a path tree for each source node in the network that can produce an update message, each path tree having that source node as a root node~~[[,]]~~ and further having a parent node~~[[,]]~~ and zero or more children nodes;

receiving ~~[[an]]~~ update ~~message~~ messages from the parent ~~node~~ nodes in accordance with the path ~~tree maintained for~~ trees rooted at the respective source ~~node~~ nodes that originated the received update ~~message~~ messages, the update ~~message~~ messages including information related to a link links in the network and being received concurrently and independently on their respective path trees;

updating the table of network topology in response to the information in the update ~~message~~ messages received via the path ~~tree~~ trees rooted at the source nodes;

and

forwarding the update ~~message~~ messages to children nodes, if any, in accordance with the path ~~tree maintained for~~ trees rooted at the source node nodes that originated the update ~~message~~ messages in response to the information in the received update ~~message~~ messages, if it is determined that the update ~~message~~ messages should be forwarded to the zero or more children nodes, such that topology information for the network is globally updated across the plurality of nodes.

2. (Currently Amended) The method of claim 1 wherein the information related to the link links indicates whether the update ~~message is~~ messages are to be forwarded to other nodes.

Response under 37 C.F.R. § 1.116

Serial No. 09/728,020

3. (Original) The method of claim 1 wherein the path tree associated with each source node is a minimum-hop-path tree.
4. (Currently Amended) The method of claim 1 further comprising obtaining link-state information from one or more nodes in the path tree ~~maintained for~~ rooted at a given source node for use in developing the path tree ~~[[to]]~~ rooted at that source node.
5. (Currently Amended) The method of claim 1 wherein the ~~link is a~~ links are wireless communication ~~link~~ links.
6. (Currently Amended) The method of claim 1 further comprising sending a new parent message to a node selecting that node as a new parent node for the source node originating ~~[[the]]~~ an update message.
7. (Original) The method of claim 6 further comprising receiving from the new parent node in response to the new parent message link-state information associated with the source node that originated the update message.
8. (Original) The method of claim 7 wherein the new parent message included a serial number and the link-state information received in response to the new parent message is associated with update messages having serial numbers that are greater than the serial number included in the new parent message.
9. (Currently Amended) The method of claim 1 further comprising:
 - determining that a path through a new parent node for ~~[[the]]~~ a source node originating ~~[[the]]~~ an update message has the same number of node hops as ~~[[the]]~~ a path through ~~[[the]]~~ a current parent node, and
 - maintaining the current parent node as the parent node for the given source node.

Response under 37 C.F.R. § 1.116
Serial No. 09/728,020

10. (Currently Amended) The method of claim 1 further comprising:
determining that a path to ~~[[the]]~~ a source node originating ~~[[the]]~~ an update message ceases to exist; and
maintaining the current parent node as the parent node for the source node.
11. (Currently Amended) The method of claim 1 further comprising broadcasting the update ~~message~~ messages to the children nodes if the number of children nodes exceeds a predefined threshold when forwarding the update ~~message~~ messages to children nodes.
12. (Currently Amended) The method of claim 1 further comprising transmitting the update ~~message~~ messages to each child node using a unicast mode if the number of children nodes is less than a predefined threshold when forwarding the update ~~message~~ messages to children nodes.
13. (Previously Presented) The method of claim 1 further comprising:
computing a parent node for each neighbor node and source node; and
determining which neighbor nodes are children nodes for a given source node.
14. (Currently Amended) A network, comprising:
a plurality of nodes in communication with each other over communication links, each node maintaining a table of network topology and a path tree for each source node in the network that can produce an update message, each path tree having that source node as a root node~~[[,]]~~ and further having a parent node~~[[,]]~~ and zero or more children nodes,
wherein one of the nodes (i) receives ~~[[an]]~~ update ~~message~~ messages from the parent ~~node~~ nodes in accordance with the path ~~tree maintained for~~ trees rooted at the source ~~node~~ nodes that originated the received update ~~message~~ messages, the update ~~message~~ messages including information related to a link links in the network and being

received concurrently and independently on their respective path trees, (ii) updates the table of network topology in response to the information in the update ~~message~~ messages received via the path tree trees rooted at the source nodes, (iii) and forwards the update ~~message~~ messages to children nodes, if any, in accordance with the path ~~tree maintained for~~ trees rooted at the source ~~node~~ nodes that originated the update ~~message~~ messages in response to the information in the received update ~~message~~ messages, if it is determined that the update ~~message~~ messages should be forwarded to the children nodes, such that topology information for the network is globally updated across the plurality of nodes.
